Talking With Children:
TIPS FOR CAREGIVERS, PARENTS, AND TEACHERS DURING INFECTIOUS DISEASE OUTBREAKS

What You Should Know

When children and youth watch news on TV about an infectious disease outbreak, read about it in the news, or overhear others discussing it, they can feel scared, confused, or anxious—as much as adults. This is true even if they live far from where the outbreak is taking place and are at little to no actual risk of getting sick. Young people react to anxiety and stress differently than adults. Some may react right away; others may show signs that they are having a difficult time much later. As such, adults do not always know when a child needs help.

This tip sheet will help parents, caregivers, and teachers learn some common reactions, respond in a helpful way, and know when to seek support.

Possible Reactions to an Infectious Disease Outbreak

Many of the reactions noted below are normal when children and youth are handling stress. If any of these behaviors lasts for more than 2 to 4 weeks, or if they suddenly appear later on, then children may need more help coping. Information about where to find help is in the Helpful Resources section of this tip sheet.

PRESCHOOL CHILDREN, 0–5 YEARS OLD

Very young children may express anxiety and stress by going back to thumb sucking or wetting the bed at night. They may fear sickness, strangers, darkness, or monsters. It is fairly common for preschool children to become clingy with a parent, caregiver, or teacher or to want to stay in a place where they feel safe. They may express their understanding of the outbreak repeatedly in their play or tell exaggerated stories about it. Some children’s eating and sleeping habits may change. They also may have aches and pains that cannot be explained. Other symptoms to watch for are aggressive or withdrawn behavior, hyperactivity, speech difficulties, and disobedience.

- **Infants and Toddlers, 0–2 years old**, cannot understand that something bad in the world is happening, but they know when their caregiver is upset. They may start to show the same emotions as their caregivers, or they may act differently, like crying for no reason or withdrawing from people and not playing with their toys.

- **Children, 3–5 years old**, may be able to understand the effects of an outbreak. If they are very upset by news of the outbreak, they may have trouble adjusting to change and loss. They may depend on the adults around them to help them feel better.
